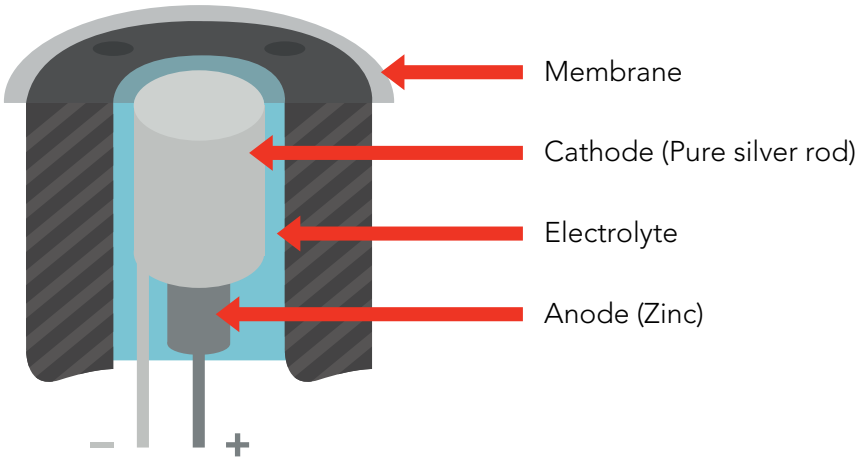
Operating principle

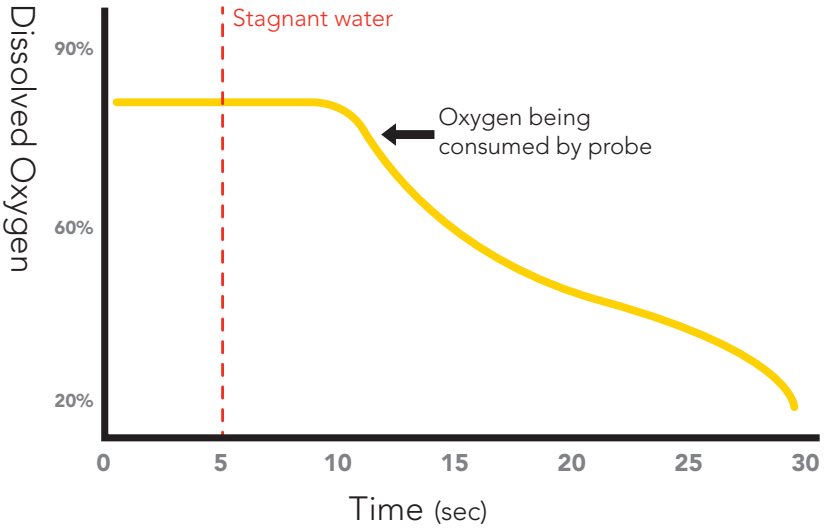
The Atlas Scientific™ EZO™ Dissolved Oxygen circuit works with:

X Optical probe	Slow response, requires external power, expensive.
X Polar Graphic probe	Requires external power, output in µA.
✓ Galvanic probe	Requires no external power, output in mV.

A galvanic dissolved oxygen probe consists of a Polytetrafluoroethylene membrane, an anode bathed in an electrolyte and a cathode. Oxygen molecules defuse through the probes membrane at a constant rate (without the membrane the reaction happens to quickly). Once the oxygen molecules have crossed the membrane they are reduced at the cathode and a small voltage is produced. If no oxygen molecules are present, the probe will output 0 mV. As the oxygen increases so does the mV output from the probe. Each probe will output a different voltage in the presence of oxygen. The only thing that is constant is that **0mV = 0 Oxygen**. (A galvanic dissolved oxygen probe can also be used to detect the Oxygen content in gases).



Flow Dependence



One of the drawbacks from using a galvanic probe is that it consumes a ***VERY*** small amount of the oxygen it reads. Therefore, a small amount of water movement is necessary to take accurate readings. **Approximately 60 ml/min**.

Calibration theory

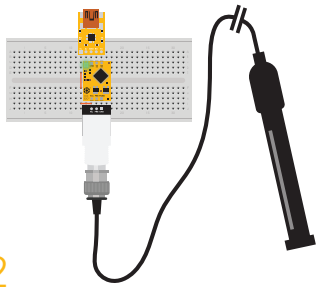
The most important part of calibration is watching the readings during the calibration process. It's easiest to calibrate the device in its default state (UART mode, continuous readings). Switching the device to I²C mode after calibration ***will not*** affect the stored calibration. If the device must be calibrated in I²C mode be sure to request readings continuously so you can see the output from the probe.

The Atlas Scientific EZO™ Dissolved Oxygen circuit, has a flexible calibration protocol, allowing for ***single point*** or ***dual point*** calibration.

Calibrate first, compensate later.
Temperature, salinity and pressure compensation values have no effect on calibration.

Single point calibration

1



2

"Cal"

3

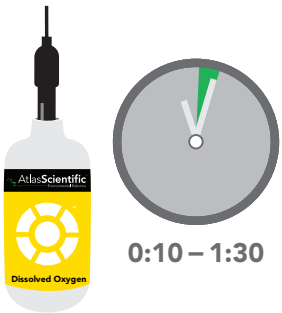
1. Pull off and discard cap from the Dissolved Oxygen probe. *(only used to protect probe during shipping)*
2. Let the Dissolved Oxygen probe sit, exposed to air untill readings stabalize *(5–30 sec)*.
3. Calibrate using the command "Cal".
4. After calibration is complete, you should see readings **~9.09 – 9.1Xmg/L**.
   (only if temperature, salinity and pressure compensation are at default values)

Dual point calibration *(optional)*

Only perform this calibration if you require accurate readings *below* 1.0 mg/L

After you have calibrated using the command "Cal"

1



2

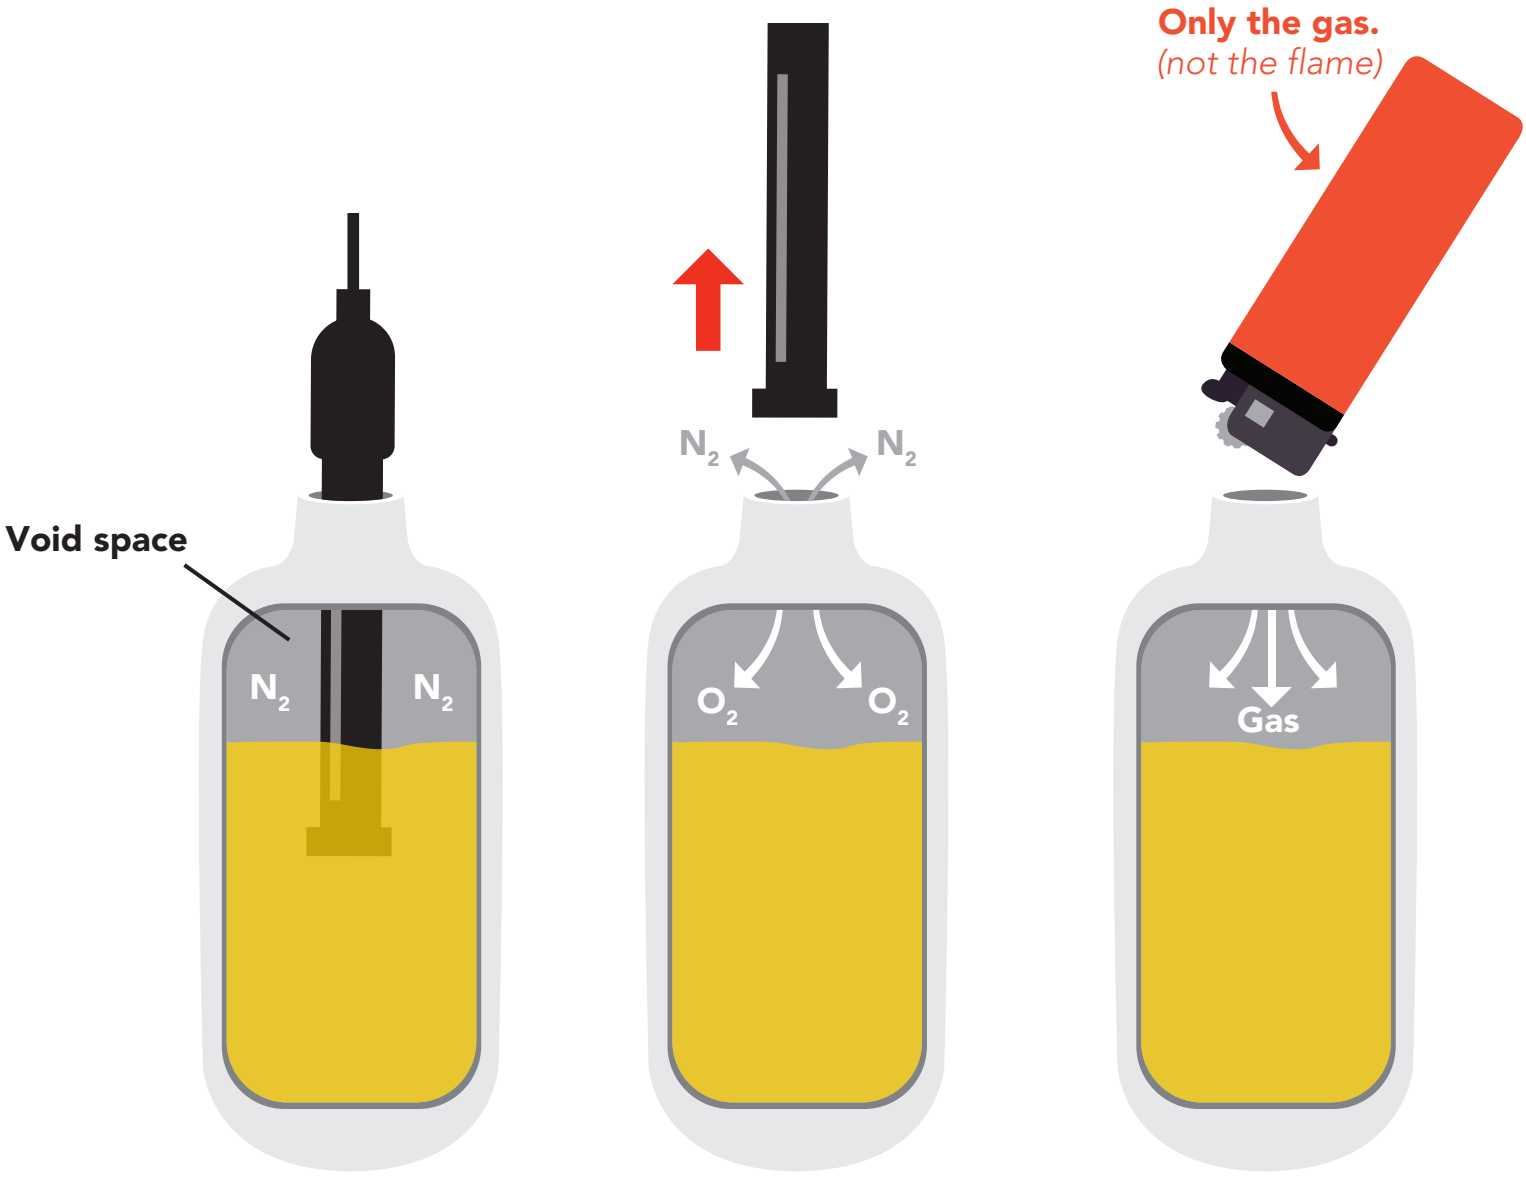
"Cal,0"

3

1. Stir probe in Zero D.O. calibration solution to remove trapped air, *(which could cause readings to go high)*.
2. Let the probe sit in Zero D.O. calibration solution untill readings stabalize *(0:10 – 1:30)*.
3. Calibrate using the command "Cal,0".

How to preserve the Zero D.O. calibration solution

Oxygen is everywhere. The Zero D.O. calibration solution has been designed to chemically absorb oxygen. Once the bottle has been opened the test solution has been exposed to oxygen and will slowly stop working.



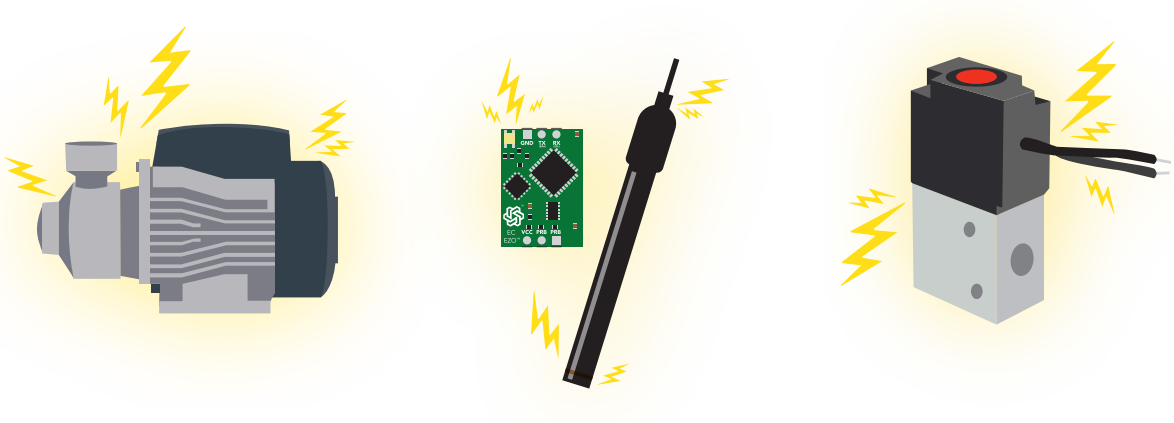
Inside each bottle of the calibration solution is a small amount of nitrogen gas that helps displace oxygen out of the bottle during the filling process. When the Dissolved Oxygen probe is removed from the bottle, oxygen will enter the bottle and begin to dissolve into the solution.

In order slow down this process, fill the void space of the bottle with any gas *(other than oxygen)* to preserve the calibration solution. Gas from a lighter works great if other gases are currently unubtainable.

Power and data isolation

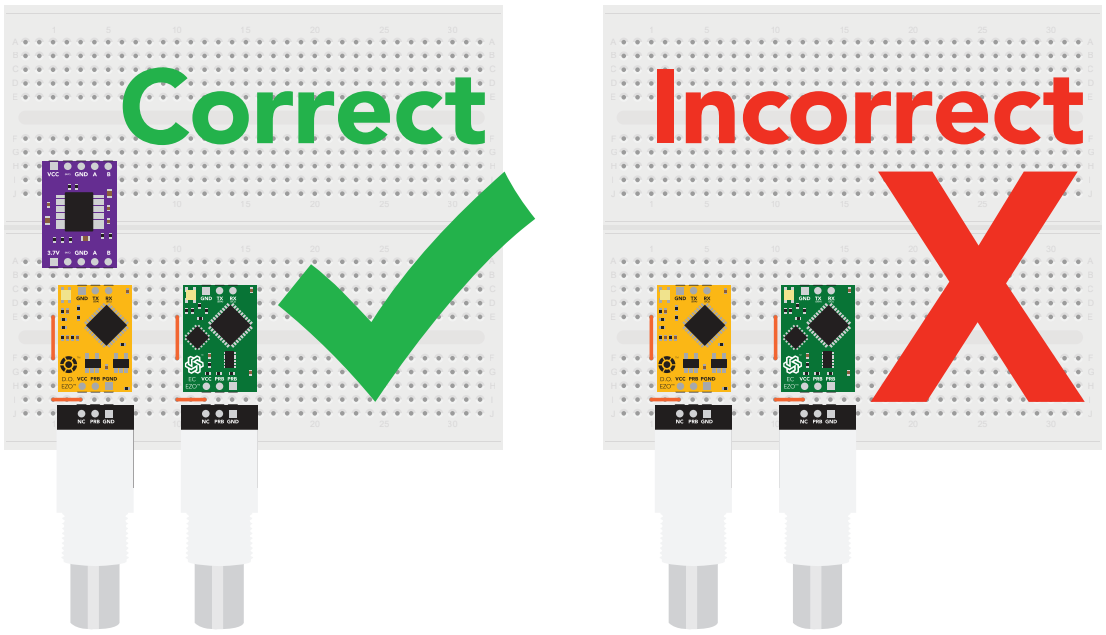
The Atlas Scientific EZO™ Dissolved Oxygen circuit is a very sensitive device. This sensitivity is what gives the Dissolved Oxygen circuit its accuracy. This also means that the Dissolved Oxygen circuit is capable of reading micro-voltages that are bleeding into the water from unnatural sources such as pumps, solenoid valves or other probes/sensors.

When electrical noise is interfering with the Dissolved Oxygen readings it is common to see rapidly fluctuating readings or readings that are consistently off. To verify that electrical noise is causing inaccurate readings, place the Dissolved Oxygen probe in a cup of water by itself. The readings should stabilize quickly, confirming that electrical noise was the issue.



When reading Dissolved Oxygen and Conductivity together, it is ***strongly recommended*** that the EZO™ Dissolved Oxygen circuit is electrically isolated from the EZO™ Conductivity circuit.

Basic EZO™ Inline Voltage Isolator



Without isolation, Conductivity readings will effect Dissolved Oxygen accuracy.

AtlasScientific™ Environmental Robotics

r 0.1

This schematic shows exactly how we isolate data and power using the *ADM3260* and a few passive components. The ADM3260 can output isolated power up to 150 mW and incorporates two bidirectional data channels.

This technology works by using tiny transformers to induce the voltage across an air gap. PCB layout requires special attention for EMI/EMC and RF Control, having proper ground planes and keeping the capacitors as close to the chip as possible are crucial for proper performance. The two data channels have a 4.7kΩ pull up resistor on both the isolated and non-isolated lines (R1, R2, R3, and R4) The output voltage is set using a voltage divider (R5, R6, and R,7) this produces a voltage of 3.7V regardless of your input voltage.

Isolated ground is different from non-isolated ground, these two lines should not be connected together.

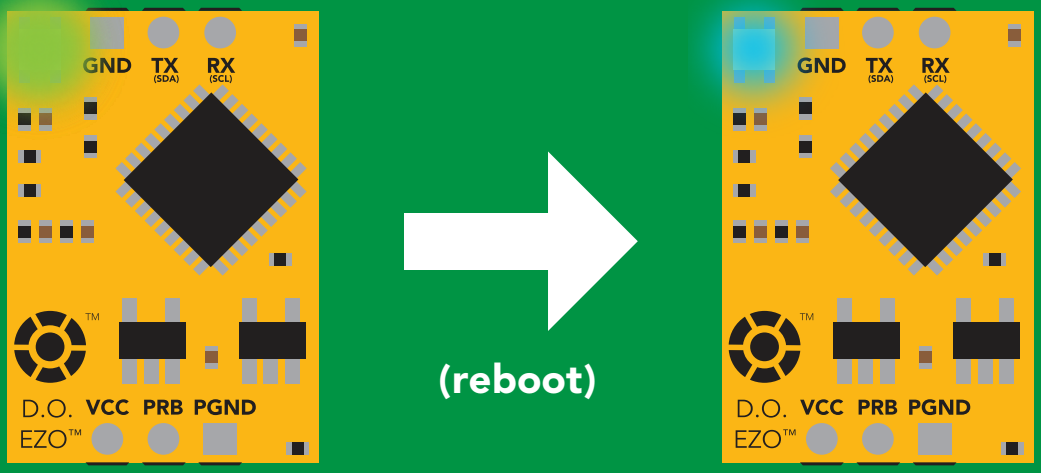
I2C,n <cr> sets I²C address and reboots into I²C mode

n = any number 1 – 127

Example	Response
I2C,100 <cr>	*OK (reboot in I²C mode)

Wrong example	Response
I2C,139 <cr> n ≯ 127	*ER <cr>

I2C,100



Green
*OK <cr>

Blue
now in I²C mode

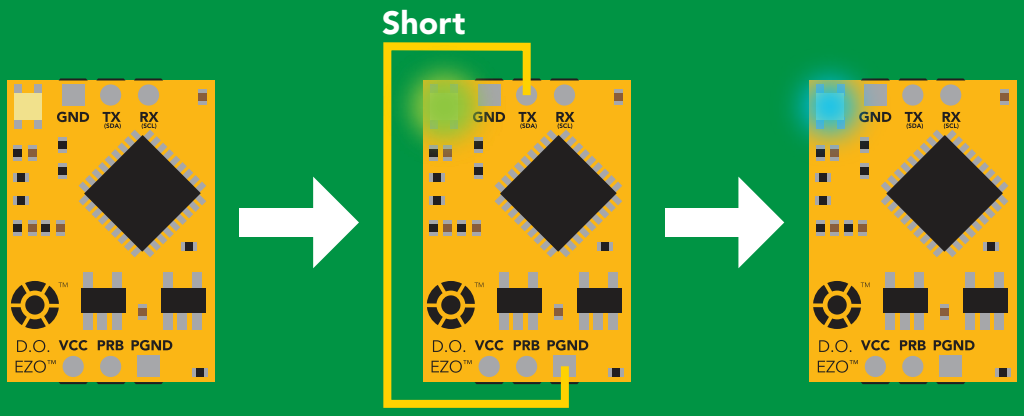
Atlas Scientific™ Environmental Robotics
r 0.2

Manual switching to I²C

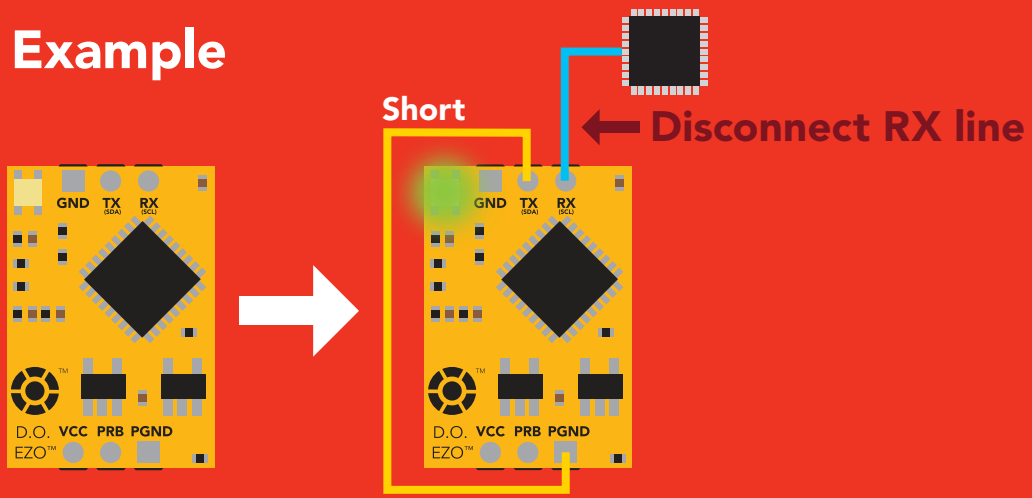
- Make sure Plock is set to 0
- Disconnect ground (power off)
- Disconnect TX and RX
- Connect TX to PGND
- Confirm RX is disconnected
- Connect ground (power on)
- Wait for LED to change from Green to Blue
- Disconnect ground (power off)
- Reconnect all data and power

Manually switching to I²C will set the I²C address to 97 (0x61)

Example



Wrong Example



I²C mode

The I²C protocol is *considerably more complex* than the UART (RS–232) protocol. Atlas Scientific assumes the embedded systems engineer understands this protocol.

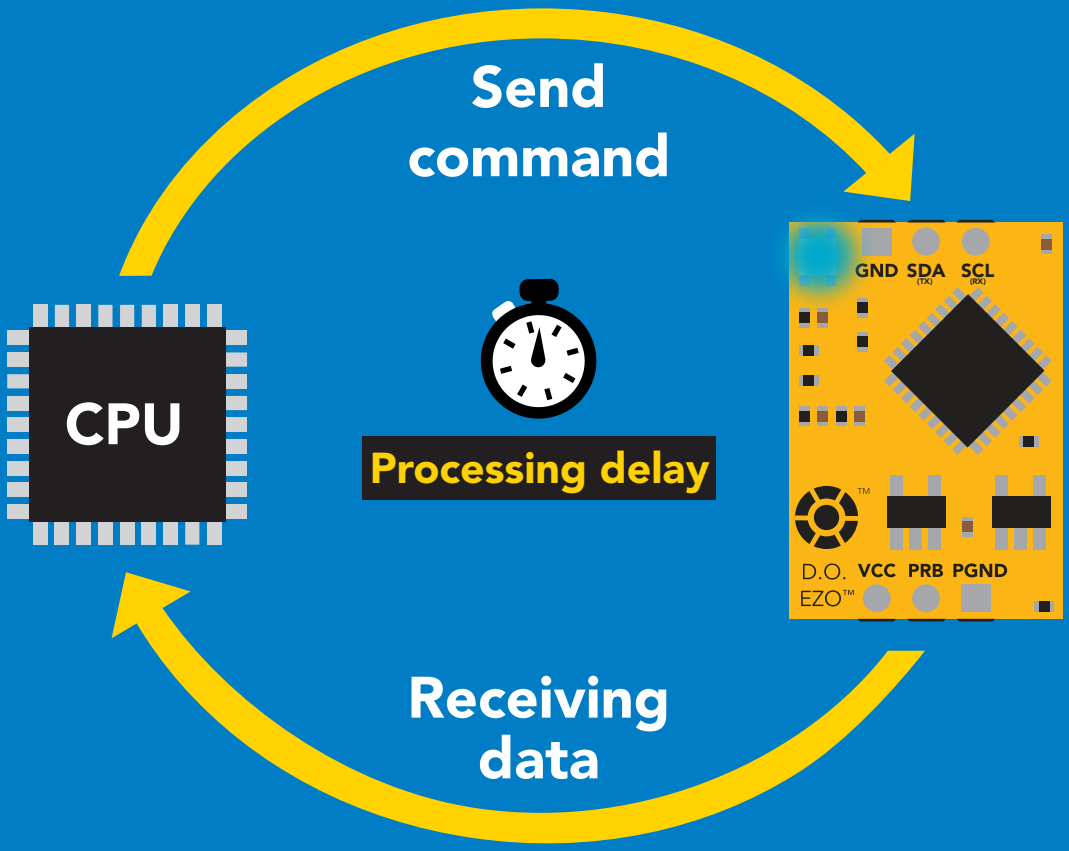
Response codes

After a command has been issued, a 1 byte response code can be read in order to confirm that the command was processed successfully.

Reading back the response code is completely optional, and is not required for normal operation.



Example

```
I2C_start;
I2C_address;
I2C_write(EZO_command);
I2C_stop;

delay(300);   Processing delay

I2C_start;
I2C_address;
Char[ ] = I2C_read;
I2C_stop;
```

The response code will always be 254, if you do not wait for the processing delay.

Response codes

Single byte, not string

255	no data to send
254	still processing, not ready
2	syntax error
1	successful request

Command syntax

300ms processing delay

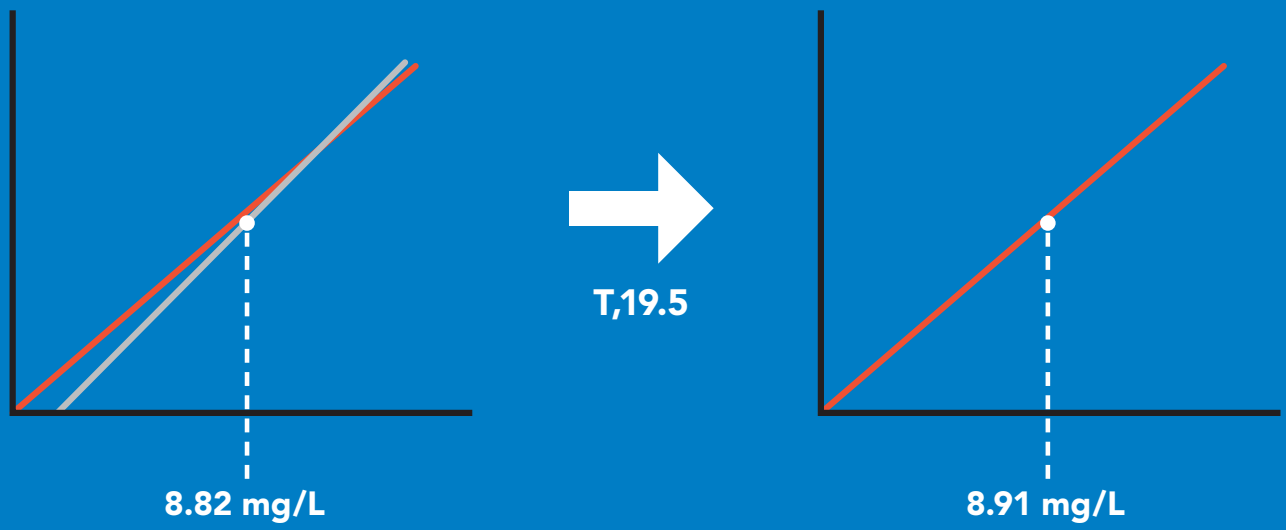
T,n	n = any value; floating point or int
T,?	compensated temperature value?

Temperature is always in Celsius

Example	Response
T,19.5	Wait 300ms — 1 (Dec) — 0 (Null)
T,?	Wait 300ms — 1 (Dec) — ?T,19.5 (ASCII) — 0 (Null)



AtlasScientific™ Environmental Robotics

Salinity compensation

Command syntax

300ms processing delay

S,n	n = any value in microsiemens	default
S,n,ppt	n = any value in ppt	
S,?	compensated salinity value?	

Example	Response
S,50000	Wait 300ms → 1 (Dec) 0 (Null)
S,37.5,ppt	Wait 300ms → 1 (Dec) 0 (Null)
S,?	Wait 300ms → 1 (Dec) ?S,50000,µS (ASCII) 0 (Null) **or** 1 (Dec) ?S,37.5,ppt (ASCII) 0 (Null)

If the conductivity of your water is less than 2,500µS this command is irrelevant

AtlasScientific™ Environmental Robotics

Pressure compensation

Command syntax

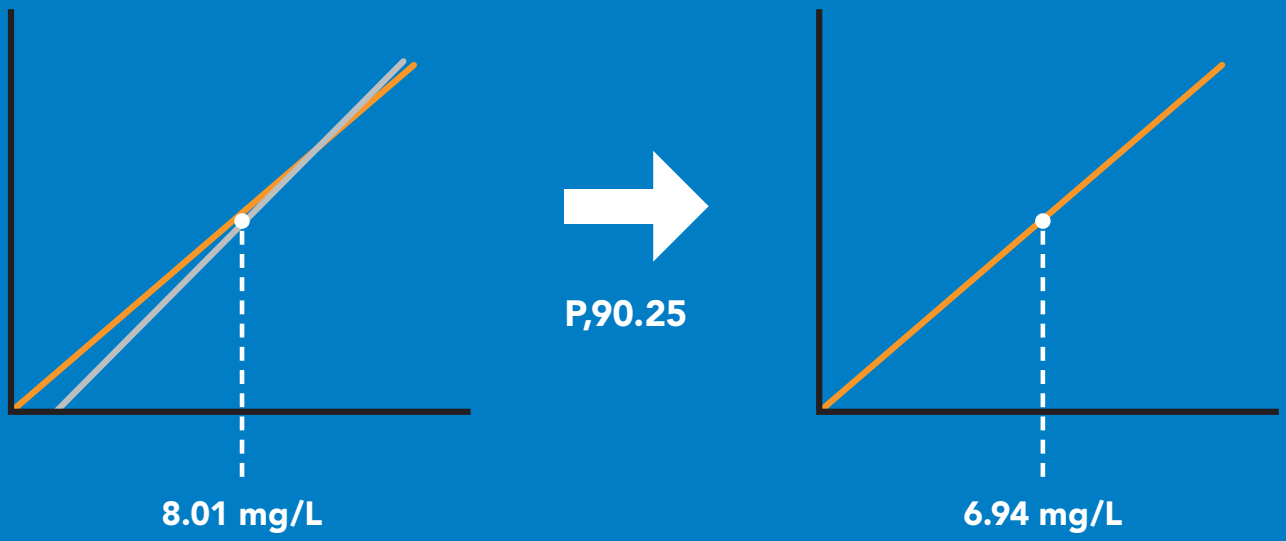
300ms processing delay

P,n n = any value in kPa

P,? compensated pressure value?

This parameter can be omitted if the water is less than 10 meters deep

Example	Response
P,90.25	Wait 300ms — 1 (Dec) 0 (Null)
P,?	Wait 300ms — 1 (Dec) ?,P,90.25 (ASCII) 0 (Null)



AtlasScientific™ Environmental Robotics

Enable/disable parameters from output string

Command syntax

300ms processing delay

O, [parameter],[1,0]	enable or disable output parameter
O,?	enabled parameter?

Example	Response	
O,mg,1 / O,mg,0	Wait 300ms	1 Dec, 0 Null — enable / disable mg/L
O,%,1 / O,%,0	Wait 300ms	1 Dec, 0 Null — enable / disable percent saturation
O,?	Wait 300ms	1 Dec, ?,O,%,mg ASCII, 0 Null — if both are enabled

Parameters

mg	mg/L
%	percent saturation

Followed by 1 or 0

1	enabled
0	disabled

* If you disable all possible data types your readings will display "no output".

Atlas Scientific Environmental Robotics

Device information

Command syntax

300ms processing delay

i device information

Example

i

Response

1	?i,D.O.,1.98	0
Dec	ASCII	Null

Response breakdown

?i,	D.O.,	1.98
	Device	Firmware

Reading device status

Command syntax

300ms processing delay

Status voltage at Vcc pin and reason for last restart

Example Response

Status

Wait 300ms

1	?Status,P,5.038	0
Dec	ASCII	Null

Response breakdown

?Status, P, 5.038

P, ↑ Reason for restart

5.038 ↑ Voltage at Vcc

Restart codes

P	powered off
S	software reset
B	brown out
W	watchdog
U	unknown

Sleep mode/low power

Command syntax

Sleep	enter sleep mode/low power

Send any character or command to awaken device.

Example	Response
Sleep	no response
Any command	wakes up device

Do not read status byte after issuing sleep command.

	STANDBY	SLEEP
5V	13.1 mA	0.66 mA
3.3V	12 mA	0.3 mA

Standby

Sleep

AtlasScientific™
Environmental Robotics
r 0.1

Protocol lock

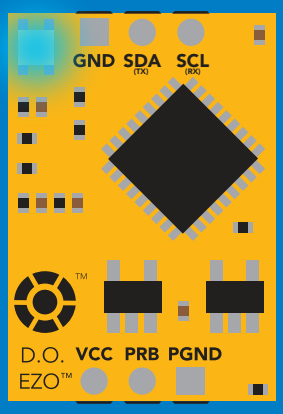
Command syntax

300ms processing delay

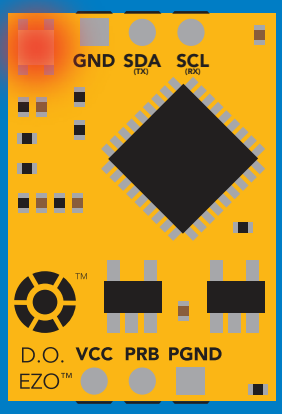
Plock,1	enable Plock	Locks device to I²C mode.
Plock,0	disable Plock	default
Plock,?	Plock on/off?	

Example	Response
Plock,1	Wait 300ms → 1 (Dec) 0 (Null)
Plock,0	Wait 300ms → 1 (Dec) 0 (Null)
Plock,?	Wait 300ms → 1 (Dec) ?Plock,1 (ASCII) 0 (Null)

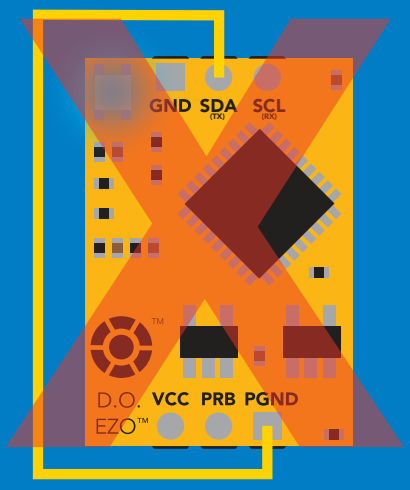
Plock,1



Serial, 9600



cannot change to UART



cannot change to UART

AtlasScientific™ Environmental Robotics

r 0.1

I²C address change

Command syntax

300ms processing delay

I2C,n sets I²C address and reboots into I²C mode

Example	Response
I2C,100	device reboot

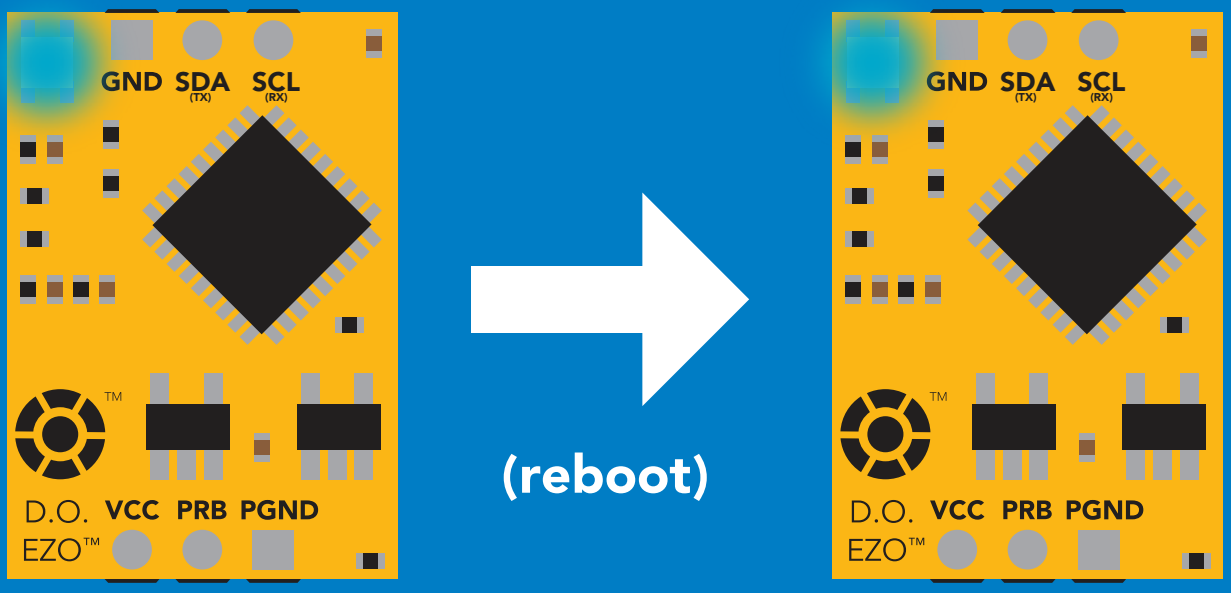
Warning!

Changing the I²C address will prevent communication between the circuit and the CPU, until your CPU is updated with the new I²C address.

Default I²C address is 97 (0x61).

n = any number 1 – 127

I2C,100



Atlas Scientific™ Environmental Robotics

r 0.2

Factory reset

Command syntax

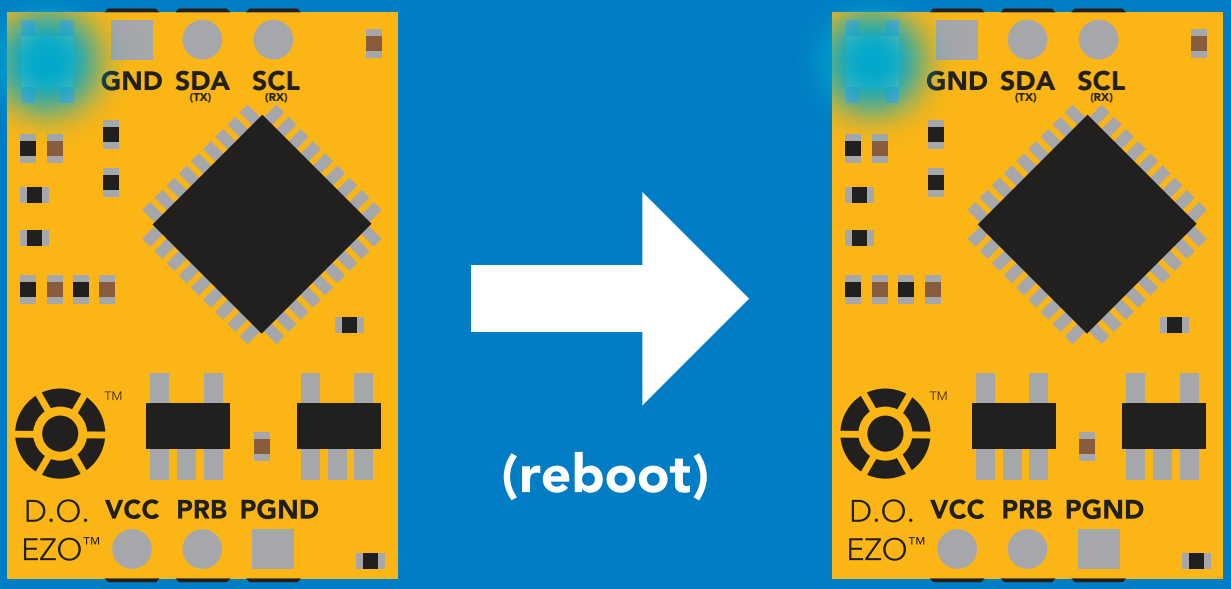
Factory reset will not take the device out of I²C mode.

Factory enable factory reset	I²C address will not change

Example	Response
Factory	device reboot

Clears calibration
LED on
Response codes enabled

Factory



Atlas Scientific™ Environmental Robotics

r 0.1

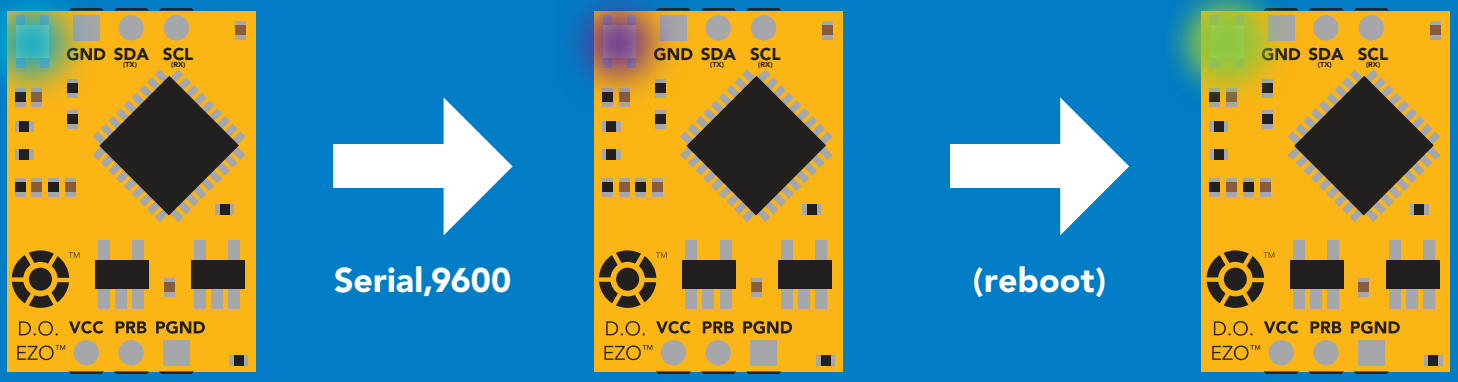
Change to UART mode

Command syntax

Baud,n switch from I²C to UART

Example	Response
Baud,9600	reboot in UART mode

n = [300, 1200, 2400, 9600, 19200, 38400, 57600, 115200]

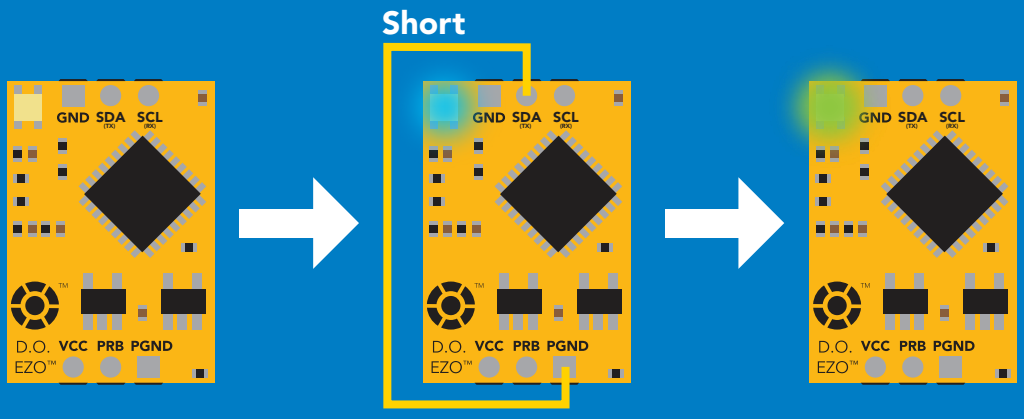


Changing to UART mode

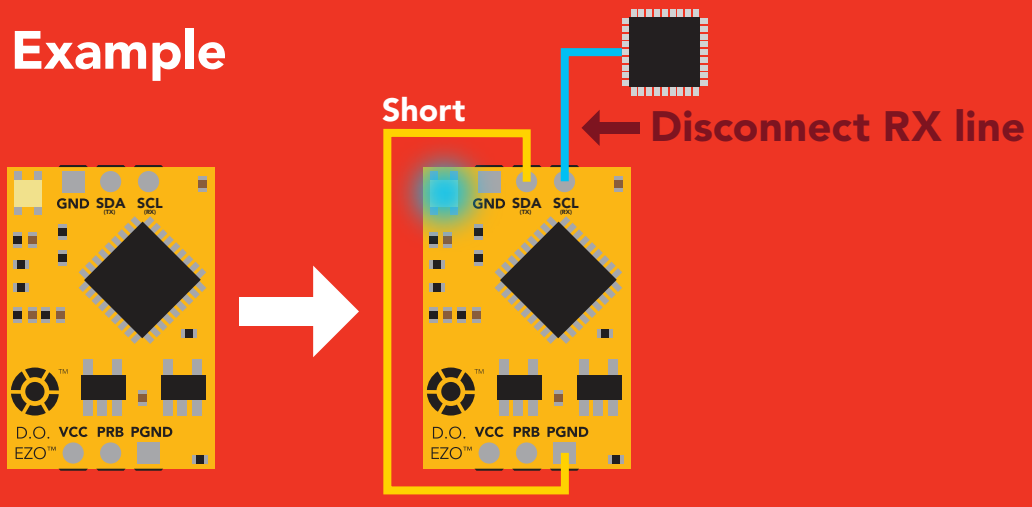
Manual switching to UART

- Make sure Plock is set to 0
- Disconnect ground (power off)
- Disconnect TX and RX
- Connect TX to PGND
- Confirm RX is disconnected
- Connect ground (power on)
- Wait for LED to change from Blue to Green
- Disconnect ground (power off)
- Reconnect all data and power

Example

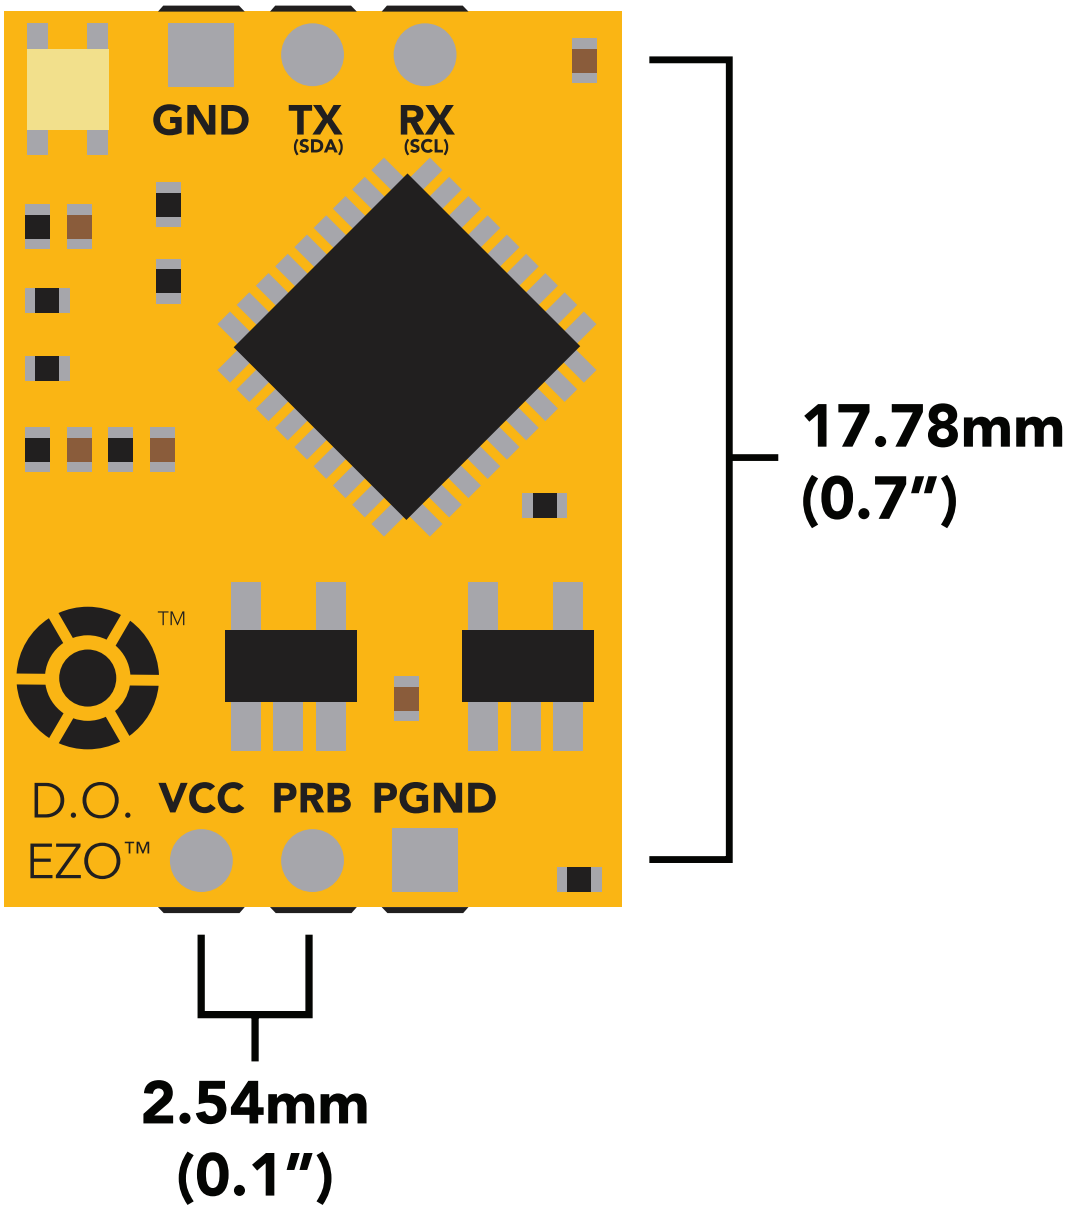


Wrong Example



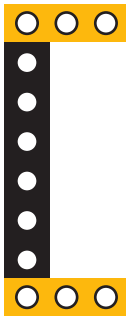
AtlasScientific™
Environmental Robotics
r 0.1

EZO™ circuit footprint



1 In your CAD software place an 8 position header.

2 Place a 3 position header at both top and bottom of the 8 position.



3 Delete the 8 position header. The two 3 position headers are now 17.78mm (0.7”) apart from each other.

Datasheet change log

Datasheet V 4.3

Added information to calibration theory on pg 7.

Datasheet V 4.2

Revised definition of response codes on pg 44.

Datasheet V 4.1

Updated firmware changes on pg. 66.

Datasheet V 4.0

Revised Enable/disable parameters information on pages 29 & 55.

Datasheet V 3.9

Revised information on cover page.

Datasheet V 3.8

Update firmware changes on pg. 66.

Datasheet V 3.7

Revised Plock pages to show default value.

Datasheet V 3.6

Added new commands:
"Find" pages 21 & 48.
"Export/Import calibration" pages 25 & 51.
Added new feature to continous mode "C,n" pg 22.

Datasheet V 3.5

Added accuracy range on cover page, and revised isolation info on pg. 10.

Datasheet V 3.4

Added manual switching to UART information on pg. 59.

Datasheet V 3.3

Updated firmware changes to refeclt V1.99 update.

Datasheet change log

Datasheet V 3.2

Revised entire datasheet.

Firmware updates

V1.1 – Initial release (Oct 30, 2014)
- Change output to mg/L, then percentage (was previously percentage, then mg/L).

V1.5 – Baud rate change (Nov 6, 2014)
- Change default baud rate to 9600

V1.6 – I²C bug (Dec 1, 2014)
- Fixed I²C bug where the circuit may inappropriately respond when other I²C devices are connected.

V1.7 – Factory (April 14, 2015)
- Changed "X" command to "Factory"

V1.95 – Plock (March 31, 2016)
- Added protocol lock feature "Plock"

V1.96 – EEPROM (April 26, 2016)
- Fixed glitch where EEPROM would get erased if the circuit lost power 900ms into startup.

V1.97 – EEPROM (Oct 10, 2016)
- Fixed glitch in the cal clear command, improves how it calculates the DO, adds calibration saving and loading.

V1.98 – EEPROM (Nov 14, 2016)
- Updated firmware for new circuit design.

V1.99 – (Feb 2, 2017)
- Revised "O" command to accept mg.

V2.10 – (April 12, 2017)
- Added "Find" command.
- Added "Export/import" command.
- Modified continuous mode to be able to send readings every "n" seconds.

V2.11 – (Sept 28, 2017)
- Fixed glitch where the temperature would default to 0 on startup.

V2.12 – (Dec 19, 2017)
- Improved accuracy of dissolved oxygen equations.

Warranty

Atlas Scientific™ Warranties the EZO™ class Dissolved Oxygen circuit to be free of defect during the debugging phase of device implementation, or 30 days after receiving the EZO™class Dissolved Oxygen circuit (which ever comes first).

The debugging phase

The debugging phase as defined by Atlas Scientific™ is the time period when the EZO™ class Dissolved Oxygen circuit is inserted into a bread board, or shield. If the EZO™ class Dissolved Oxygen circuit is being debugged in a bread board, the bread board must be devoid of other components. If the EZO™ class Dissolved Oxygen circuit is being connected to a microcontroller, the microcontroller must be running code that has been designed to drive the EZO™ class Dissolved Oxygen circuit exclusively and output the EZO™ class Dissolved Oxygen circuit data as a serial string.

It is important for the embedded systems engineer to keep in mind that the following activities will void the EZO™ class Dissolved Oxygen circuit warranty:

- **Soldering any part of the EZO™ class Dissolved Oxygen circuit.**
- **Running any code, that does not exclusively drive the EZO™ class Dissolved Oxygen circuit and output its data in a serial string.**
- **Embedding the EZO™ class Dissolved Oxygen circuit into a custom made device.**
- **Removing any potting compound.**

Reasoning behind this warranty

Because Atlas Scientific™ does not sell consumer electronics; once the device has been embedded into a custom made system, Atlas Scientific™ cannot possibly warranty the EZO™ class Dissolved Oxygen circuit, against the thousands of possible variables that may cause the EZO™ class Dissolved Oxygen circuit to no longer function properly.

Please keep this in mind:

1. **All Atlas Scientific™ devices have been designed to be embedded into a custom made system by you, the embedded systems engineer.**
2. **All Atlas Scientific™ devices have been designed to run indefinitely without failure in the field.**
3. **All Atlas Scientific™ devices can be soldered into place, however you do so at your own risk.**

Atlas Scientific™ is simply stating that once the device is being used in your application, Atlas Scientific™ can no longer take responsibility for the EZO™ class Dissolved Oxygen circuits continued operation. This is because that would be equivalent to Atlas Scientific™ taking responsibility over the correct operation of your entire device.
